Chapter 1

Rust in a Nutshell

1.1 Why Rust?

1.2 Cargo

1.3 Cargo Doc

1.4 Crates

1.5 Basic Data Structures

1.5.1 Sequences

1.5.1.1 Vec

1.5.1.2 VecDeque

1.5.1.3 LinkedList

1.5.2 Maps

1.5.2.1 HashMap

1.5.2.2 BTreeMap

1.5.3 Sets

1.5.3.1 HashSet

1.5.3.2 BTreeSet

1.5.4 Other

1.5.4.1 BinaryHeap

1.6 Basic Algorithms

1.7 Other Useful things

1.8 Regex

1.9 Derive Macros

1.10 Counting in $O(1)$ space with slices

Chapter 2

Macros for Rust

2.1 test!

Unlike C and C++, a testing framework is built into rust. We can create our own tests by creating a mod block and letting cargo know that we want to test it.

Let's say we create this function:

```
src/add.rs
```

```
fn add(a: i32, b: i32) -> i32 {  
    a + b  
}
```

We can test it at the bottom of the file:

```
src/add.rs
```

```
...  
#[cfg(test)]  
mod test {  
    use super::*;  
  
    #[test]  
    fn add_one_and_one() {  
        assert_eq!(add(1, 1), 2);  
    }  
  
    #[test]  
    fn add_one_and_two() {
```

```

    assert_eq!(add(1, 2), 3);
  }
}

```

Macros let us reduce most of the boilerplate:

src/lib.rs

```

#[macro_export]
macro_rules! test {
  ($($name:ident: $left:expr, $right:expr,)* ) => {
    #[cfg(test)]
    mod test {
      use super::*;
      $(
        #[test]
        fn $name() {
          assert_eq!($left, $right);
        }
      )*
    }
  }
}

```

Test can then be called like so:

src/add.rs

```

test! {
  add_one_to_one: add(1, 1), 2,
  add_one_to_two: add(1, 2), 3,
}

```

Chapter 3

Introductory

3.1 Contains Duplicate

3.1.1 Problem

Given an integer array `nums`, return `true` if any value appears at least twice in the array, and return `false` if every element is distinct.

3.1.2 Intuition

3.1.3 Test Cases

```
[] == false
[1] == false
[1,1] == true
[1,2,3] == false
[1,2,1] == true
```

3.1.4 Using Sets

If a slice of numbers is the same length as the set of its numbers, we know that the slice **only contains** unique numbers. With this, we can find the solution to the problem:

3.1.5 Complexity

$O(n)$ time, $O(n)$ space. We take $O(n)$ time to convert the slice into the `HashSet`, and the `HashSet` takes $O(n)$ space as well.

3.1.6 Answer

```
use std::collections::HashSet;

pub fn contains_duplicate(nums: &[i32]) -> bool {
    let num_len = nums.len();
    let s: HashSet<i32> = HashSet::from_iter(nums.iter());
    s.len() != num_len
}
```

Chapter 4

Trees

4.1 Maximum Path through a Binary Tree

```
type Node = Option<Rc<RefCell<TreeNode>>>>;

pub fn max_path_sum(root: Node) -> i32 {
    let mut max_so_far = i32::MIN;
    fn helper(node: &Node, max_so_far: &mut i32) -> i32 {
        match node {
            Some(n) => {
                let val = n.borrow().val;
                let l = max(0, helper(&n.borrow().left, max_so_far));
                let r = max(0, helper(&n.borrow().right, max_so_far));
                *max_so_far = max(*max_so_far, val + l + r);
                val + max(l, r)
            }
            None => 0,
        }
    }
    helper(&root, &mut max_so_far);
    max_so_far
}
```

4.2 Validate Binary Search Tree

```
type Node = Option<Rc<RefCell<TreeNode>>>>;

pub fn is_valid_bst(root: Node) -> bool {
    fn helper(node: &Node, possible_min: i64, possible_max: i64) -> bool {
        if let Some(n) = node {
            let borrowed = n.borrow();
            let left = &borrowed.left;
            let right = &borrowed.right;
            let val: i64 = borrowed.val.into();
            if val >= possible_min && val <= possible_max {
                helper(&left, possible_min, val) && \
                helper(&right, val, possible_max)
            } else {
                false
            }
        } else {
            true
        }
    }
    helper(&root, i64::MIN, i64::MAX)
}
```

4.3 Same Tree

```
type Node = Option<Rc<RefCell<TreeNode>>>>;

pub fn is_same_tree(p: Node, q: Node) -> bool {
    fn is_same(p: &Node, q: &Node) -> bool {
        match (p, q) {
            (Some(left), Some(right)) => {
                let left = left.borrow();
                let right = right.borrow();
                left.val == right.val
                && same(&left.left, &right.left)
                && same(&left.right, &right.right)
            }
            (None, None) => true,
            (None, _) | (_, None) => false,
        }
    }
}
```

```
    is_same(&p, &q)  
}
```
